

## ABSTRACT

5 In a current conducting terminal in contact with the positive electrode of a battery (A)  
and with the negative electrode of a battery (B) in order to conduct current between the two  
batteries (A), (B), a conductive polymer is placed between the positive electrode side  
electrode 1, which is in contact with the positive electrode of the battery (A), and the negative  
electrode side electrode (2), which is in contact with the negative electrode of the battery (B).
